**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

SK

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/649,409	SCHRODINGER, KARL	
	<b>Examiner</b>	<b>Art Unit</b>	
	Agustin Bello	2613	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 14 March 2007.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 17-31 and 33-38 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 17-31, 33-36 and 38 is/are rejected.
- 7) ☒ Claim(s) 37 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 17-27, and 34-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen (U.S. Patent No. 6,862,322) in view of Williams (U.S. Patent No. 4,574,249).

Regarding claim 17, Ewen teaches an optical reception device (reference numeral 101 in Figure 3A); and an amplifier (reference numeral 102 in Figure 3A) connected to said reception device; said amplifier having a gain (inherent); and said amplifier including at least one control terminal that receives a control signal (reference numeral 301 in Figure 3A) for setting said gain of said amplifier between at least two gain values (e.g. by virtue of changing the impedance of the transimpedance amplifier via the control line) in a continuously various manner (i.e. “dynamically adjusting” of (column 6 lines 1-22)). Ewen differs from the claimed invention in that Ewen fails to specifically teach that at least one gain value between the at least two gain values is optimized for maximum sensitivity. However, Williams teaches that optimizing at least one gain value between the at least two gain values for maximum sensitivity is well known in the art (column 20 lines 27-28). One skilled in the art would have been motivated to optimize at least one gain value between the at least two gain values for maximum sensitivity since doing so extends the dynamic range of the receiver without sacrificing sensitivity (column 19 lines 31-37 of Williams). Therefore, it would have been obvious to one skilled in the art at the time the

Art Unit: 2613

invention was made to optimize at least one gain value between the at least two gain values for maximum sensitivity.

Regarding claim 18, Ewen teaches the receiver circuit according to claim 17, wherein said amplifier is a transimpedance amplifier (reference numeral 102 in Figure 3A).

Regarding claim 19, Ewen teaches that said amplifier has a feedback impedance (reference numeral 314 in Figure 3B) for influencing said gain of said amplifier.

Regarding claim 20, Ewen teaches that said feedback impedance (reference numeral 314 in Figure 3B) has an impedance value that is set by a signal at said control terminal (reference numeral 202 in Figure 3B).

Regarding claim 21, Ewen teaches that said feedback impedance (reference numeral 314 in Figure 3B) has a resistance value that is set by a signal at said control terminal (reference numeral 202 in Figure 3B).

Regarding claims 22 and 25, Ewen teaches that said feedback impedance is formed by an impedance network with at least one switching device (reference numeral 314 in Figure 3B) that is switched by said signal at said control terminal (reference numeral 202 in Figure 3B) and said switching device (reference numeral 314 in Figure 3B) alters said impedance of said feedback impedance (reference numeral 314 in Figure 3B) when said switching device is switched.

Regarding claim 23 and 26, Ewen teaches that said switching device is formed by a switching transistor (reference numeral 203 in Figure 2B).

Regarding claim 24 and 27, Ewen differs from the claimed invention in that Ewen fails to specifically teach that said switching transistor (reference numeral 203 in Figure 2B) is a MOS-FET transistor or a bipolar transistor. However, Ewen discloses that the use of other types of

Art Unit: 2613

devices besides the N-type FET shown can be used, thereby suggesting either MOS-FET transistor or a bipolar transistor. Furthermore, both MOS-FET transistor and a bipolar transistor are very well known in the art and readily available. Moreover, Williams teaches the use of MOSFET transistor in a similar receiver (column 19 lines 65-67). Therefore, it would have been obvious to one skilled in the art at the time the invention was made to employ either MOS-FET transistors or bipolar transistors in the device of Ewen without departing from the spirit of the invention.

Regarding claim 34, Ewen teaches that the at least two gain values are selected to be individually adapted to transmission rates selected from the group of 1 Gbps, 2 Gbps, and 4 Gbps (column 3 lines 31-39).

Regarding claim 35, the combination of Ewen and Williams teaches that the sensitivity is optical sensitivity (inherent in both Ewen and Williams).

3. Claim 28 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen in view of Williams as applied to claim 17, and further in view of Kimura (U.S. Patent No. 7,105,797).

Regarding claim 28, the combination of Ewen and Williams teaches the receiver circuit of claims 17 and 33, and further teaches that said reception device is a photodiode (reference numeral 101 in Figure 3A of Ewen). The combination of Ewen and Williams differs from the claimed invention in that it fails to specifically teach a duty cycle control that prevents pulse distortions by feeding a current into the amplifier. However, Kimura teaches a duty cycle control that prevents pulse distortions by feeding a current into the amplifier (reference numeral 5 in Figure 1; reference numeral 9 in Figure 4). One skilled in the art would have been motivated to include a duty cycle control in the device of the combination of references in order

Art Unit: 2613

to reduce pulse width distortion and widen dynamic range (column 7 lines 1-7 of Kimura).

Therefore, it would have been obvious to one skilled in the art at the time the invention was made to include a duty cycle control that prevents pulse distortions by feeding a current into the amplifier.

4. Claims 29-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen in view of Williams as applied to claim 17, and further in view of Lewis (U.S. Patent No. 7,002,131).

Regarding claims 29 and 30, Ewen differs from the claimed invention in that Ewen fails to specifically teach a package for packaging said optical reception device and said amplifier; said package being a T0-46 package, a TSSOP package, or a VQFN20 package, wherein the package has a terminal pin forming the control terminal. However, Lewis teaches that incorporating a receiver like that of the combination of Ewen and Williams into a TO-46 package that includes a terminal pin is well known in the art (column 3 lines 57-63). One skilled in the art would have been motivated to use a TO-46 package due to its thin outline.

Furthermore, Ewen discloses that the invention can be implemented in any physical package (column 3 lines 4-10). Therefore, it would have been obvious to one skilled in the art at the time the invention was made to surround the receiving circuit in package, said package being one of the well known and readily available T0-46 package, a TSSOP package, or a VQFN20 package, and include in the package a terminal pin forming the control terminal.

5. Claim 31 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen in view of Gaboury (U.S. Patent No. 5,498,865).

Regarding claim 31, Ewen teaches prescribing a gain value for an amplifier of the receiver circuit in dependence on a bandwidth prescribed for the receiver circuit; setting the gain value of the amplifier at a control terminal of the amplifier by selecting an impedance of an impedance network, wherein the impedance of the impedance network includes at least one variable impedance such that the impedance can be variably set, and after setting the gain value of the amplifier, using the amplifier to amplify an output signal of an optical reception device (column 5 line 63 – column 6 line 22). Ewen differs from the claimed invention in that Ewen fails to specifically teach determining the gain value in accordance with an equation:  $V = K / B$ , K specifying a maximum achievable bandwidth-gain product previously determined for the receiver circuit and B denoting the bandwidth prescribed for the receiver circuit. However, Gaboury teaches that optical receiver circuits such as that claimed by applicant and taught by Ewen are known to be governed by the equation  $V = K / B$  (column 1 lines 16-43). That being so, one skilled in the art would have determined the gain value in accordance with the equation claimed by applicant and shown by Gaboury as being well known in the art. Therefore, it would have been obvious to one skilled in the art at the time the invention was made to determine the gain value in the device of Ewen in accordance with the equation claimed.

6. Claim 33 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen in view of in view of Kimura (U.S. Patent No. 7,105,797).

Regarding claim 33, Ewen teaches the receiver circuit as noted in the rejection of claim 17. Ewen differs from the claimed invention in that it fails to specifically teach a duty cycle control that prevents pulse distortions by feeding a current into the amplifier. However, Kimura teaches a duty cycle control that prevents pulse distortions by feeding a current into the amplifier

Art Unit: 2613

(reference numeral 5 in Figure 1; reference numeral 9 in Figure 4). One skilled in the art would have been motivated to include a duty cycle control in the device of the combination of references in order to reduce pulse width distortion and widen dynamic range (column 7 lines 1-7 of Kimura). Therefore, it would have been obvious to one skilled in the art at the time the invention was made to include a duty cycle control that prevents pulse distortions by feeding a current into the amplifier.

7. Claims 36 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen in view of Kimura, as applied to claim 33 above, and further in view of Mohandas (U.S. Patent No. 6,933,786).

Regarding claim 36, the combination of Ewen and Kimura differs from the claimed invention in that it fails to specifically teach a coding device that recodes the control signal such that the impedance network forms the desired impedance. However, Mohandas teaches a coding device (reference numeral 16, 20 in Figure 1) that recodes the control signal such that the impedance network forms the desired impedance. One skilled in the art would have been motivated to include a coding device that recodes the control signal such that the impedance network forms the desired impedance in order to adjust the input impedance of the circuit (abstract of Mohandas). Therefore, it would have been obvious to one skilled in the art at the time the invention was made to include a coding device that recodes the control signal such that the impedance network forms the desired impedance in the device of the combination of references.

Art Unit: 2613

8. Claims 38 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ewen and Williams, as applied to claim 17 above, and further in view of Mohandas (U.S. Patent No. 6,933,786).

Regarding claim 38, the combination of Ewen and Williams differs from the claimed invention in that it fails to specifically teach a coding device that recodes the control signal such that the impedance network forms the desired impedance. However, Mohandas teaches a coding device (reference numeral 16, 20 in Figure 1) that recodes the control signal such that the impedance network forms the desired impedance. One skilled in the art would have been motivated to include a coding device that recodes the control signal such that the impedance network forms the desired impedance in order to adjust the input impedance of the circuit (abstract of Mohandas). Therefore, it would have been obvious to one skilled in the art at the time the invention was made to include a coding device that recodes the control signal such that the impedance network forms the desired impedance in the device of the combination of references.

#### ***Allowable Subject Matter***

9. Claim 37 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

#### ***Response to Arguments***

10. Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection for claims 28, 33, 36, and 38.

Art Unit: 2613

11. Applicant's arguments filed 3/14/07 regarding claims 17 and 31 have been fully considered but they are not persuasive. The applicant argues that Ewen fails to specifically teach the features of the claimed invention by pointing to an embodiment not relied upon by the examiner in formulating the rejection of the claims. As such, the applicant has failed to address the rejection at hand. Given this, the examiner maintains the rejection of the claimed invention based on the previously cited art.

***Conclusion***

12. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Agustin Bello whose telephone number is (571) 272-3026. The examiner can normally be reached on M-F 8:30-6:00.

Art Unit: 2613

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jason Chan can be reached on (571)272-3022. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

A handwritten signature in black ink, appearing to read "A. Bello". The signature is fluid and cursive, with a large initial "A" and a stylized "Bello".
